HydroWorx and Running Study

Metabolic-Cost Comparison of Submaximal Land and Aquatic Treadmill Exercise

M Erin Rutledge, W. Matt Silvers, Kathy Browder, and Dennis Dolny
Department of Health, Physical Education, Recreation and Dance, University of Idaho

Purpose:
This study was conducted in order to evaluate the metabolic cost of varying aquatic treadmill exercise speed and water-jet resistance and compare with land treadmill conditions at similar running speeds.

Method:
Fifteen male and female college aged track and field athletes participated in the study. Subjects completed nine, five minute submaximal underwater treadmill workouts with jets at varying resistance using a HydroWorx pool.

Results:
Limbing loading was reduced significantly in the underwater treadmill sessions. The energy expenditure per stride ranged from 30%-56% greater during underwater running than in land running.

Conclusion:
Underwater treadmill training offers viable exercise alternatives to land treadmill running as a way to maintain or improve fitness for injured and healthy individuals.
